Declaration under 37 C.F.R. 1.131

Declaration under 37 C.F.R. 1.131 dated 3/5/08 has been received.

Allowable subject matter

Claims 1-6, 15-18 are allowed.

The following is an examiner's statement of reasons for allowance:

The prior art neither discloses nor suggests the following limitations, in combination with the remaining elements as disclosed in claims 1 and 15:

A method of partitioning a reference database for determining a reflectance spectrum comprising the steps of establishing a plurality of clusters, each cluster initially being an empty sets and assigning each training samples to the most appropriate cluster, thereby filling the empty sets, each training sample correlating a reference spectrum with a corresponding plurality of normalized illuminant sensor outputs for reference colors as required by claims 1 and 15.

Proper motivation has not been found in any references for combining teachings to disclose the claimed invention.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Peschmann (US Pub 2005/0058242) discloses that detected

scatter spectra are divided by the looked-up transmission spectra, detector cluster consisting of four channels centered on the four corners of a 2 by 2 mm square. But Peschmann fails to disclose the steps of establishing a plurality of clusters, each cluster initially being an empty set and assigning each training samples to the most appropriate cluster, thereby filling the empty sets, each training sample correlating a reference spectrum with a corresponding plurality of normalized illuminant sensor outputs for reference colors. Yang et al. (USP 7,103,225) discloses that spectral clustering technique can be applied to yield clusters of images, scanning sample of images and a matrix is normalized by computation. But Yang does not explicitly disclose each training sample correlating a reference spectrum with a corresponding plurality of normalized illuminant sensor outputs for reference colors
